## Wasp Pest Control

---

Wasps are aggressive with a predatory nature and can sting multiple targets. These insects are long and thin, have dangling legs, four wings, and are mostly brightly colored. Although some wasps in Utah are wingless, they all prey on pest insects and **prefer digging in the ground or staying in shrubs or up tall trees**. The **solitary wasp** species **never stay in nests while the social species nest indoors or outdoors**. They lay their eggs in bodies of other parasite hosts. Wasps measure between 12 and 17 mm in length.

Wasps are a hazard due to their painful stings. Although these stings are not known to be fatal, they ***sometimes require medical attention***. Homes with seniors or children should be extremely vigilant against wasp infestations since their stings ***may cause an allergic reaction*** to their skins. Our wasp pest control specialists in Utah at [Legacy Pest Control](#) are at your service and ready to help you exterminate all wasp nests from your property.

## Hornet Pest Control

---

These pests are ***more aggressive than wasps*** with a predatory nature. They have the abilities to ***sting multiple targets***, and their stings ***can*** be fatal to humans. Hornets in Utah resemble wasps, but they are black and white with some bright color. Also, they have thicker and more rounded bodies when compared to wasps. They have fat heads and stay in large nests. They feed on sweet plant matter while their larvae are fed with insects or actively consume their hosts. The ***Hornets in Utah nest outside in trees, shrubs, or sometimes under decks and eaves***. They lay their eggs in high nests built specially for them. Hornets measure 1.8 to 5.5 cm long. Hornets are dangerous due to their multiple stinging capabilities that can be fatal to humans. All homeowners should always take necessary precautions to ensure that these insects do not invade their properties. ***Our hornet pest control professionals at Legacy Pest Control in Utah will get rid of all hornets that have infested your property using pet and kid-friendly techniques.***

## Yellow Jacket Pest Control

---

These insects resemble bees in their black and yellow appearance although some of the species are black and white. The yellow jackets in Utah are predatory wasps, and they use distinct side-to-side flight patterns before landing. ***Only the females have stings***. They feed on sweet plant matter. ***Yellow jackets can sting multiple times, but their venom can only be fatal to individuals who are allergic to the substance*** and the effects are felt after multiple stings. ***They construct their nests in shrubs, mouse burrows, tree stumps, and human-made structures like your home or office***. Yellow Jacket measure about 12 to 19 mm long. They are not fatal to humans except those who are allergic to their venom. However, you should take precautions to ensure that they do not invade your home. ***Our Utah yellow jacket pest control experts are just a call away waiting to help you eradicate all yellow jacket nests on your property using pet and kid friendly methods.***

## Wasps, Hornets and Yellow Jackets Facts

---

- **Prevention** – Since all these wasps' species build their nests in shrubs and other protected areas, ensure that you clear all bushes and inspect all protected areas around your property. Identify and eliminate any mouse burrows and tree stumps nearby before the wasps invade them and momentarily colonize your space.
- **Social Structure** – Most of these wasps stay in groups especially the yellow jackets that hunt together.
- **Stings** – Only the Hornets' stings are fatal to humans. The stings of wasps and yellow jackets only affect individuals with allergies to the substances contained in the

stings.

Legacy Pest Control offers a free estimate for help getting rid of **RODENTS**.
